

Convin Assignment

Hi

Below is the description of the assignment. The deadline is 2 days from today.

Problem: In this assignment, you have to implement salesforce integration. Which include fetching user token from salesforce using OAuth2. Once you have the token You need to fetch the list of Users, Accounts, and Contacts from salesforce and store it in the database.

You need to write the code in Django. You are not supposed to use any existing third-party salesforce integration app

Please create a GitHub repo and upload code there. Looking forward to your submission.
Have a great day

Thank You
